

Secure Off Site Storage Facility

Secure Offsite Storage offers the facility to back up data in accordance with a planned schedule, so that in the event of a computer failure, all is not lost. This will provide protection against theft, fire, flood or malicious damage. Many companies offer off site storage space, however this leaves the onus on the user to backup their data to an unknown location. This could be virtually anywhere in the world, which is not a satisfactory solution, especially as security and integrity of the data is an unknown quantity.

ES Systems offers secure offsite storage with the advantage of you knowing exactly where your data is and that it is safe. Our site is in a secluded rural location, protected by up to date security technology, including CCTV cameras and infrared security beams. So you can rest assured more than adequate protection is in place.

Initially we will need to install software onto your server to provide the backup and the configuration of a secure connection between your site and ours. This connection or VPN (Virtual Private Network) will be via broadband and will be subject to military strength encryption, with the added protection provided by a secure Cisco firewall.

After deciding on the data that you require backing up, you will be allocated your own personal space on one of 5 state of the art servers. The servers have additional protection against power surges or failures, whilst being in a temperature controlled environment. We monitor all backups, and reports are available on a pre-agreed time scale for each individual user's requirements.

In the event that a disaster does occur, the service will provide you with access to a PC workstation, set up at our site, to enable you to access your data. This will hopefully assist in reducing any inconvenience by getting you back up and running in the earliest time as possible, albeit on a reduced scale.
